

PVS-14 TUBE UPGRADE

We can help you easily swap out the old green phosphor tubes in your PVS-14 night vision units with new white phosphor tubes. **Have you seen the differences between the green and white tubes?**

L3 Insight Technology tubes are available in standard green and improved white phosphor technology for greater target detection and recognition. Lowlight and nighttime maneuvers appear more natural in black and white, with added contrast detail in shapes and shadows providing the operator more visual information for assessment and acquisition. White phosphor offer various shades of intensity between black and white (over black and green), resulting in better contrast and depth perception. This provides the ability to increase survivability and allows warfighters to complete their mission accurately and effectively.
